-1-SUBONT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY A LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS:
PROTEIN M AND GLYCOPROTEIN E. THE NUCLEOCAPSID IS A COMPLEX OF PROTEIN C AND MRNA.

66-00me polyprotein [Contains Capsid protein C (Core protein) (P22);
Envelope 91ycoprotein E1 (GP32) (GP35); Envelope 91ycoprotein E2 (GP68) (GP70) (MS1); Protein P7: Nonstructural protein NS2 (P21)
(EC 3.4.22.-); Protease/helicase NS3 (P70) (Hepacivirin)
(EC 3.4.21.98); Nonstructural protein NS4A (P4); Nonstructural protein NS4B (P27); Nonstructural protein NS5A (P56); Nonstructural protein NS5A (P56); Constructural protein NS5A (P60) (RNA-directed RNA polymerase) (EC 2.7.7.48)].
Hepatitis C virus (Isolate Taiwan) (HCV).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               the viral

-I- FUNCTION: PROTEASE NS2 IS RESPONSIBLE FOR THE CLEAVAGE OF NS2-NS3.

-I- FUNCTION: PROTEASE NS3 IS RESPONSIBLE FOR THE CLEAVAGE OF NS3-NS4A, NS4A-NS4B, NS4B-NS5A AND NS5A-NS5B.

-I- FUNCTION: NS4A FORMS A COMPLEX WITH NS3 AND IS ESSENTIAL FOR THE ACTIVATION OF NS3.
                                                                                                                                                                                                                                                                Gaps

FUNCTION: NS5A SEEMS TO HAVE A TRANSCRIPTIONAL ACTIVATORY ROLE.
FUNCTION: NS5B IS A RNA-DEPENDENT RNA POLYMERASE THAT PLAYS AN
SESENTIAL ROLE IN THE VIRUS REPLICATION.
CATALYIIC ACTIVITY: Hydrolysis of four peptide bonds in the viral
precursor polyprotein, commonly with Asp or Glu in the P6
position, Cys or Thr in P1 and Ser or Ala in P1'.
CATALYIIC ACTIVITY: N nucleoside triphosphate +
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Polyprotein; Glycoprotein; Transferase; RNA-directed RNA polymerase;
Core protein; Coat protein; Envelope protein; Helicase; ATP-binding;
Transmembrane; Nonstructural protein; Hydrolase; Serine protease;
                                                                                                                                                SUBDIVIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY A LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS: E1 AND E2. THE NUCLEOCAPSID IS A COMPLEX OF PROTEIN C AND MRNA.

PTH: THE STRUCTURAL PROTEINS C. E1 AND E2 ARE PRODUCED BY PROTEOLYTIC PROCESSING BY THE HOST SIGNAL PEPTIDASES.

SIMILARITY: THE NS2 PROTEASE BELONGS TO PEPTIDASE FAMILY 039.

SIMILARITY: THE NS3 PROTEASE BELONGS TO PEPTIDASE FAMILY S29.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  REMOVED FROM CAPSID PROTEIN C
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 PROTEASE/HELICASE NS3.

-!- CATALYTIC ACTIVITY: AFP + H(2)0 - ADP + phosphate.
-!- SUBCELLULAR LOCATION: Integral membrane protein.
-!- SIMILARITY: Belongs to the cation transport ATPases family (P-type ATPases). Subfamily IB.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         STRAIN=CDC 1551 / Oshkosh;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   SIMILARITY).

SUBUNIT: DNA POLYMERASE ALPHA-PRIMASE IS A FOUR SUBUNIT ENZYME
(SUBUNITS A, B, C AND D), WHICH IS ASSEMBLED THROUGHOUT THE CELL
CYCLE. THE LARGEST SUBUNIT (SUBUNIT A) HAS DNA POLYMERASE
ACTIVITY, THE TWO SUBLILEST SUBUNITS (SUBUNITS C AND D) HAVE DNA
PRIMASE ACTIVITY. SUBUNIT B BINDS TO SUBUNIT A.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ALPHA/PRIMASE COMPLEX TO THE CELLULAR REPLICATION MACHINERY (BY

```
Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ALIGNMENTS

HCJ238800 9033 bp RNA linear VRL 18-AUG-1999
Hepatitis C virus type 1b complete genome, isolate NC1.
AJ28800
AJ238800. GI:5748510
Complete genome: core protein; glycoprotein E1; glycoprotein E2;
NS2 proteinase; NS3 proteinase/Helicase; NS3/4A proteinase
cofactor; NS4b protein; NS5A phosphoprotein; NS5B RNA dependant RNA
Hepatitis C virus type 1b
Hepatitis C virus type 1b
Viruses; SSRNA positive-strand viruses, no DNA stage; Flaviviridae;
Hepacivirus.

                                                                                                                                                                                      linker segments which were used in the creation of a fusion molecule of the coding sequences for Hepatitis C virus (HCV) NS3 and NS4A protease enzymes. These proteins are both essential for the replication of the virus, acting to cleave its replicative proteins from the polyprotein produced from the HCV genome. Inhibitors of the two proteins should be effective as antiviral treatments of HCV infection. This is useful as HCV can lead to chronic liver disease such as cirrhosis, liver failure and NS3-NS4A fusion proteins which can be used to identify inhibitors of this type, as well as enabling structural studies of the protease and
                                                                                                             Modified hepatitis C virus (HCV) NS3 protease comprising at least 1 substitution of a hydrophobic alpha-helix 0 amino acid to a hydrophilic amino acid, useful for screening inhibitors that may treat hepatitis C
                                                                                                                                                                               present sequence is one of two oligonuclectides coding for NS4A and

The present sequence is one of two oligonuclectides coding for NS4A and linker segments which were used in the creation of a fusion molecule of the coding sequences for Hepatitis C virus (HCV) NS3 and NS4A protease enzymes. These proteins are both essential for the replication of the virus, acting to cleave its replicative proteins from the polyprotein produced from the HCV genome. Inhibitors of the two proteins should be effective as antiviral treatments of HCV infection. This is useful as HCV can lead to chronic liver disease such as cirrhosis, liver failure and liver cancer. The present invention concerns a number of NS3 mutants and NS3-NS4A fusion proteins which can be used to identify inhibitors of this
                                                                                                             Modified hepatitis C virus (HCV) NS3 protease comprising at least 1 substitution of a hydrophobic alpha-helix 0 amino acid to a hydrophilic amino acid, useful for screening inhibitors that may treat hepatitis C
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Hepatitis; NS3 protease; viral replication; chronic liver disease;

                                                                                                                   The present sequence is the coding sequence for a fusion protein created using the Hepatitis C virus (HCV) MS3 and MS4A protease enzymes. These proteins are both essential for the replication of the virus, acting to cleave its replicative proteins from the polyprotein produced from the HCV genome. Inhibitors of the two proteins should be effective as antiviral treatments of HCV unfection. This is useful as HCV can lead the present invention concerns a number of NS3 mutants and NS3·NS4A fusion proteins which can be used to identify inhibitors of this type, as well as enabling structural studies of the protease and
                                  Modified hepatitis C virus (HCV) NS3 protease comprising at least 1 substitution of a hydrophobic alpha-helix 0 amino acid to a hydrophilic amino acid, useful for screening inhibitors that may treat hepatitis C
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Hepatitis; NS3 protease; viral replication; chronic liver disease;

fusion protein created using the Hepatitis C virus (HCV) NS3 and NS4A protease enzymes. These proteins are both essential for the replication of the virus, acting to cleave its replicative proteins from the replication polyprotein produced from the HCV genome. Inhibitors of the two proteins should be effective as antiviral treatments of HCV infection. This is should be effective as antiviral treatments of HCV infection. This is mutants and liver cancer. The present invention concerns a number of NS3 mutants and NS3-NS4A fusion proteins which can be used to identify inhibitors of this type, as well as enabling structural studies of the protease and protease:inhibitor complexes. The protein produced from this sequence contains the alpha-helix0-1 variant.
Modified hepatitis C virus (HCV) NS3 protease comprising at least 1 substitution of a hydrophobic alpha-helix \theta amino acid to a hydrophilic amino acid, useful for screening inhibitors that may treat hepatitis C

The sequences given in AAQ32472-82 and AAQ32442 are various clones which encode the NS2-NS4 regions of the Hepatitis C Virus (HCV) gene of the invention. These sequences were isolated from the serum of a patient suffering from hepatitis C (HC). The isolated RNA sequences were converted into cDNA using transcriptase in the presence of one of the primer sequences given in AAQ3251964. The sequences were then amplified using primer pairs. The cDNA sequences isolated represent different alleles of the same region of the HCV gene. Sequence comparisons of these clones showed that it is possible for a AAQ32436.

chimeric Repatitis C virus (HCV)-pestivirus genome. The construct comprises a pestivirus genome where a Npro pestivirus protease gene is replaced with a gene encoding a functional HCV NS3 protease. Furthermore, each junction site recognised by the Npro protease is replaced with a junction site recognised by the HCV NS3 protease. The construct is useful for screening compounds that inhibit HCV in vivo by inhibiting HCV protease, where screening may be in cell culture or in an animal model. The present sequence is a chimmeric clone of BVDV (bovine viral diarrhea virus)/HCV NS3-wt, which was used to illustrate the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention describes a covalent hepatitis C virus (HCV) NS4A-NS3 complex comprising a central hydrophobic domain of native HCV NS4A-NS3 serine protease domain, where the hydrophobic domain of native HCV NS4A peptide is tethered by the linker to the amino terminus of the HCV NS3 protease domain. The covalent NS4A-NS3 complexes are useful for structural determination and determination of mode of binding of HCV inhibitors by NMR spectroscopy. They can also be used for detecting inhibitors of the protease activity, the helicase activity and the ATPase activity of NS3. The covalent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                HCV: hepatitis C virus; single chain recombinant complex; linker; NS3 protease; NS4A cofactor; NS4A-NS3 complex; serine protease; hydrophobic domain; covalent complex; detection; inhibitor; primer; ss.

The present invention describes a covalent hepatitis C virus (HCV) NS4A-NS3 complex comprising a central hydrophobic domain of native HCV NS3 serine protease domain. Where the hydrophobic domain of native HCV NS4A peptide is tethered by the linker to the amino terminus of the HCV NS4A peptide is tethered by the linker to the amino terminus of the HCV NS3 protease domain. The covalent NS4A-NS3 complexes are useful for structural determination and determination of mode of binding of HCV inhibitors by NMR spectroscopy. They can also be used for detecting inhibitors of the protease activity, and the ATPase activity of NS3. The covalent NS4A-NS3 complexes are more soluble, stable and active than the non-covalent protease-peptide complexes previously available. The present sequence represents a primer used in the construction of the

NS4A-NS3 complex contraining a central hydrophobic domain of native HCV NS4A-NS3 complex a linker, and an HCV NS3 serine protease domain, where the hydrophobic domain of native HCV NS4A serine protease domain, where the hydrophobic domain of native HCV NS4A serine protease domain, where the hydrophobic domains of the HCV NS3 protease domain. The covalent NS4A-NS3 complexes are useful for structural determination and determination of mode of binding of HCV inhibitors by MNR spectroscopy. They can also be used for detecting inhibitors of the protease activity and the ATPase activity of NS3. The covalent NS4A-NS3 complexes are more soluble, stable and active than the non-covalent protease-peptide complexes previously available. The present sequence represents a primer used in the construction of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention describes a covalent hepatitis C virus (HCV) NSAA-NS3 complex comparison a central hydrophobic domain of native HCV NS4A peptide, a linker, and an HCV NS3 serine protease domain, where the hydrophobic domain of native HCV NS4A peptide is tethered by the linker to the amino terminus of the HCV NS3 perclease domain. The covalent NS4A NS3 complexes are useful for structural determination and determination of mode of binding of HCV inhibitors by NMR spectroscopy. They can also be used for detecting inhibitors of the protease activity and the Arpase activity of NS3 complexes are more soluble, stable and active than the

The present invention describes a covalent hepatitis C virus (HCV) NS4A-NS3 complex comprising a central hydrophobic domain of native HCV NS4A peptide, a linker, and an HCV NS3 estine protease domain, where the hydrophobic domain of native HCV NS4A peptide is tethered by the linker to the amino terminus of the HCV NS4A peptide is tethered by the linker to the amino terminus of the HCV NS3 protease domain. The covalent MS4A-NS3 complexes are useful for structural determination and determination of mode of binding of HCV inhibitors by NMR spectroscopy. They can also be used for detecting inhibitors of the protease activity, the helicase activity and the APPase activity of NS3. The covalent non-covalent protease peptide complexes previously available. The present sequence represents a primer used in the construction of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      21-NOV-2002
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         RESULT 14
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ABX1006
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Score:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention describes a covalent hepatitis C virus (HCV) NS4A-NS3 complex comprising a central hydrophobic domain of native HCV NS4A-NS4 peptide, a linker, and an HCV NS3 serine protease domain, where the hydrophobic domain of native HCV NS4A peptide is tethered by the linker to the amino terminus of the HCV NS3A peptide is tethered by the linker to the amino terminus of the HCV NS3A protease domain. The covalent NS4A-NS3 complexes are useful for structural determination and determination of mode of binding of HCV inhibitors by NMR spectroscopy. They can also be used for detecting inhibitors of the protease activity and the ATPase activity of NS3. The covalent NS4A-NS3 complexes are more soluble, stable and active than the non-covalent protease-peptide complexes previously available. The present sequence represents a primer used in the construction of the

The invention relates to inhibiting expression of a target gene in a cell by introducing at least two oligoribonuclectides (dsrNaI and II), both with a double-stranded (ds) structure of at most 49 sequential nucleotide pairs. At least part of one strand (Si, S2) of the ds structures in each of dsrNaI and II are complementary to regions in the target gene. The method uses antisense inhibition of gene expression using double stranded RNA inhibition (RNAI). The method is particularly used to treat tumours or infections, especially by plasmodium or viruses/viroids (pathogenic on humans, animals or plants). The method provides more effective inhibition of expression than known methods using a single dsRNA, even at very low concentrations. When dsRNA has at least one unpaired nucleotide at the end, stability (and thus effective concentration in the cell) is improved and efficiency can be increased further by pretreating the cells with interferon. The present sequence is that of a target DNA of the
                                                                                                                                                                                                                                                                                                                                                                                                 Inhibiting expression of target genes, useful e.g. for treating tumors, by introducing into cells two double-stranded RNAs that are complementary to the target
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        interferon; oncogene; cytokine; Id; developmental;

This invention describes a novel method for inhibiting expression of a target gene by introducing into the cell that contains the target gene at least one oligoribonuclectide (GRNNI) that has a double-stranded (ds) structure of not more than 49 consecutive nucleotides (nt), where at least a segment of one strand of the ds structure is complementary with the target gene and the cells are treated with interferon before introduction of dsRNAI. The method is used to inhibit expression of target genes, particularly oncogenes, cytckine genes, Id (not defined) protein genes; developmental or prior genes corpuses or virois pathogenic organisms (particularly plasmodia) or in viruses or virois (pathogenic in humans, animals or plants). Treating the cells with interferon greatly increases the extent to which dsRNA can inhibit expression of the target genes, and the effect is even greater when dsRNA are modified to increase their stability, ABX09936-ABX10075 represent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          RNA inhibition; dsRNA1; gene expression inhibitor; oncogene; cytostatic; virucide; protozoacide; gene; ds.
                                                                                                                                                                           Inhibiting expression of target genes, e.g. oncogencs, in cells, by introduction of complementary double-stranded oligoribonucleotide, after treating the cell with interferon
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    gene fragments used to illustrate the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   161

The invention relates to inhibiting expression of a target gene (I) in a cell by introducing an inhibitory RNA (dsRNA1) having a double-stranded structure of at most 49 consecutive bases. At least part of one strand (asi) of dsRNA1 is complementary to (I) and at least part of one strand has an overhang of 1-4 nucleotides. The method is used to inhibit the expression of a wide range of genes, e.g. oncognese, cytokine genes etc. In humans, also genes in plasmodium or in viruses or viroids that are pathogenic for humans, animals or plants. Introducing an overhang into dsRNA greatly increases effectiveness for inhibiting que expression, both in vivo and in vitro and also increases stability and thus the effective concentration inside the cell. The present sequence is that of
                                                                                                                                                          the

BE556909
/note-"Vector: pT7T3D-Pac with a modified polylinker;
Site_1: EcoRI; Site_2: NotI; 1st strand cDNA was prepared
from zebrafish(C32) fin, and was then primed with a Not I
oligo(dT) primer. Double-stranded cDNA was ligated to
Eco RI adaptors (Pharmacia), digested with Not I and
cloned into the Not I and Eco RI sites of the modified
pT7T3 vector. Library is non-normalized. Library was
constructed by Ning Wu. NOTE: This clone is available
royalty-free through LLNL; contact the IMAGE Consortium
(info.inl.gov)for further information.

Ext from a cDNA of a gene whose expression is spatially restricted during embrygonesis. We have esstablished its expression pattern during embrygonesis. We have esstablished its expression pattern on zebrafish embryos from the gastrula stage to 2 days of development. The corresponding data are available on the zebrafish community database at http://zfin.org/cDNA library preparation: B. Riggleman. DNA Sequencing by:IGBMC sequencing facility. Clone distribution: zebrafish international resource center at the University of Oregon (Institute of Neuroscience, 1254 University of Oregon. Eugene. OR 97403-1254).
Seq primer: T3 ATTAACCCTCACTAAAGGGA.
